Content

From the talk, we discover that there are many knowledge from the talk that has been presented by MR. TS. Abdul Alim. First thing first, He talked about waterfall methodology and agile. The waterfall methodology is a project management approach that focus on a project's linear flow from start to finish. However, this method is currently out of date because it just progresses linearly through each phase and does not think about enhancing the present outcome to the better one. At the end of the phases, the result may not meet the user's requirements. To fix this problem, agile approach were created to help.

Agile methodology is a project management approach that focuses cross-functional collaboration and continuous improvement. It divides projects into smaller phases and guides teams through cycles of planning, execution, and evaluation. For example, let say we open a burger stall by using an agile approach, the main ingredient to make a burger is bun, patty, vegetable and sauce. By using an agile approach, we can get a customer's feedback to improving the ingredient of our burger. Suppose that the customer wants to add a piece of cheese and then we provide them a burger with cheese. The more feedback we receive, the more we can improve our burger. That is what we referred to as an agile approach.

This figure show the difference between Waterfall and Agile Methodology

REFLECTION

Mohamed Alif Fathi Bin Abdul Latif

What I got from the talk is there are several ways that we can use to handle a project. For instance, we can use Agile method to develop a good system quickly. To manage this system, I need to gain more knowledge about project management skills. With this skills, I can become a good system analyst and system design. Communication also crucial to learn so that I share information in a group teammate and client with ease. Therefore, communication and project management skills are important as a computer science student.

Muhammad Afiq Danial Bin Rozaidie

My reflection from the talk is that there are many method currently that we can use to manage our system more systematic. For example, waterfall helps ensure that the procedure is completed quickly and less time consuming. Meanwhile the agile approach can help to make a improvement based on the customer's complain and feedback. All i can say is that both method have their own pros and cons, we just need to choose which one is suitable for managing the system. And of course the method is not limited only for agile and waterfall approach.

Ahmad Adib Zikri bin A.Mazlam

My reflection from the talk that there are few skill that need to be applied to manage a project. We need to use different method in project management. To say that, agile methodology is very suitable for project management. Because we can improve the project within the feedback from the customer. Not to say that waterfall methodology also being used in project management. But the problem is that it not accept the change in a phase after the phase is done. So, for me both method can be used in project management but depends on what the project is.
